

Description:

it is about scanning a pcap file. Someone hacked a persons pc we have to veiw the pcap file to find out the flag.

Tools:

wireshark,linux strings, online in-browser dynamite labs,google AI Mode,Cyberchef in-browser.

Steps:

1.I downloaded the pcap file.

2.I checked it on wireshark but it showed nothing

3.SO I checked on an online named dynamite labs,but it also showed nothing.

SO I remembered that I once scanned a pcap file of an htb box with strings.

4.So, when I checked it it gave me a base64 string.

5.then I googled it.

6.it gave me the flag but it was incorrect.

7.So, I used cyberchef but it cant solve it.

I brainstormed AI mode for some time and then it gave another flag I tried it and it worked.

CHALLENGE SOLVED.
